

Amendments to the Claims:

1. (Currently amended) A method of a wireless communication device for managing dynamic containers comprising:

detecting a current time of the wireless communication device;

selecting a particular channel among a plurality of channels associated with a dynamic container of the wireless communication device based on the current time of the wireless communication device; and

displaying a unit of content of the particular channel via the dynamic container if an update time of the particular channel corresponds to the current time of the wireless communication device.

2. (Original) The method of claim 1, wherein the update time corresponds to a time period when content of the particular channel is recurrently updated.

3. (Original) The method of claim 1, further comprising determining the update time by monitoring user interaction with the at least one channel during a predetermined time period.

4. (Currently Amended) The method of claim 1, further comprising determining the update time by receiving the update time from a user of the wireless communication device.

5. (Original) The method of claim 1, wherein further comprising obtaining the unit of content of the particular channel before the update time of the particular channel.

6. (Currently Amended) A method of a wireless communication device for managing dynamic containers comprising:

detecting a current location of the wireless communication device;

selecting a particular channel among a plurality of channels associated with a dynamic container of the wireless communication device based on the current location of the wireless communication device; and

displaying a unit of content of the particular channel via the dynamic container if an associated location of the particular channel corresponds to the current location of the wireless communication device.

7. (Original) The method of claim 6, wherein the associated location corresponds to a location of a source associated with the particular channel.
8. (Original) The method of claim 6, further comprising determining the associated location by receiving the associated location from a source associated with the particular location.
9. (Original) The method of claim 6, further comprising obtaining the unit of content of the particular channel after the particular channel is selected.
10. (Currently Amended) A wireless communication device for managing dynamic containers comprising:
 - a timing circuit configured to detect a current time of the wireless communication device;
 - a processor, coupled to the timing circuit, configured to select a particular channel, among a plurality of channels, associated with a dynamic container of the wireless communication device based on the current time of the wireless communication device; and
 - a display, coupled to the processor, configured to provide a unit of content of the particular channel via the dynamic container if an update time of the particular channel corresponds to the current time of the wireless communication device.
11. (Original) The wireless communication device of claim 10, wherein the update time corresponds to a time period when content of the particular channel is recurrently updated.
12. (Original) The wireless communication device of claim 10, further comprising a transceiver, coupled to the processor, wherein the processor determines the update time by monitoring user interaction with the at least one channel via the transceiver during a predetermined time period.
13. (Original) The wireless communication device of claim 10, further comprising a user interface coupled to the processor, wherein the processor determines the update time by receiving the update time from the user interface.
14. (Original) The wireless communication device of claim 10, wherein further comprising a transceiver, coupled to the processor, configured to obtain the unit of content of the particular channel before the update time of the particular channel.

15. (Currently Amended) A wireless communication device for managing dynamic containers comprising:

a location circuit configured to detect a current location of the wireless communication device;

a processor, coupled to the location circuit, configured to select a particular channel, among a plurality of channels, associated with a dynamic container of the wireless communication device based on the current location of the wireless communication device; and

a display, coupled to the processor, configured to provide a unit of content of the particular channel via the dynamic container if an associated location of the particular channel corresponds to the current location of the wireless communication device.

16. (Original) The wireless communication device of claim 15, wherein the associated location corresponds to a location of a source associated with the particular channel.

17. (Original) The wireless communication device of claim 15, further comprising a transceiver, coupled to the processor, configured to receive the associated location from a source associated with the particular location.

18. (Original) The wireless communication device of claim 15, further comprising a transceiver, coupled to the processor, configured to obtain the unit of content of the particular channel after the particular channel is selected.

19. and 20. (Cancelled)
